

# PANATAPE II

The Panatape II is Panavision's second generation ultrasonic range finder. It measures the distance of an object from the camera film plane. The unit's range is approximately 2 to 20 feet. This device is most useful when the camera assistant cannot easily judge the distance from the camera to the subject. Examples include: shots where it is not possible to get marks (i.e., no rehearsal, over water, etc.), critical close-ups, the camera and/or subject are floating, and in cases when the actors simply will not stay on their marks.

The microprocessor controlled system digitally filters out interference to ensure the user a steady reading. A "near-far" adjustment controls the maximum range as well as the width of the area covered by the sound beam. Built-in Panatape II wherever necessary.

## SUMMARY OF FEATURES

.....  
*signal noise*

- *Increased range*
- *Adjustable power (near-far adjustment)*
- *Large LED display is easily readable in the dark*
- *Remote display included—up to 100' away (ideal for crane work, etc.)*
